New feature implementation

Implemented feature

The fusion localizer based on EKF algorithm. This is a rewrite of #2131, and there has been no major change from the old one.
As minor changes,

- add twist_generator (following [EKF design for stable localization autoware_ai#581](#)) in runtime_manager window
- move kalman_filter libraries to amathutils_lib package

Related issues are below.

[autowarefoundation/autoware_ai#581](#) : kalman filter design
[autowarefoundation/autoware_ai#461](#) : localization overall architecture

Implementation description

In this PR, I added 2 new packages

- ekf_localizer
- twist_generator

and modified 1 package

- amathutils_lib

ekf_localizer reads EGO_TWIST(now `/can_twist`) and EGO_POSE(now `/ndt_pose`) message to generate robust less-noisy ego-pose(`/ekf_pose`) and ego-twist(`/ekf_twist`) with vehicle dynamics information. Some other features in EKF include time delay compensation (mainly for large time delay of NDT localization), or mahalanobis gate (for outlier measurement data) and so on.

The more detail is described in [README](#).

twist_generator aims to generate twist message from some resources. In this PR, `/vehicle_status_converter` node is implemented in the package, which converts `/vehicle_status` to `/can_twist`. This node includes `enable_adaptive_estimate` parameter which enables estimation of correction coefficients for conversion with recursive least square. This function is for parameter mismatch, such as wheelbase or steering gear ratio. In this PR, this node is very similar to `/can_status_translator` in autoware_connector pkg in that it converts `/vehicle_status` to twist (`can_status_converter` converts `vehicle_status` to odom). But, twist_generator provides twist estimation algorithms (discussed based on [autowarefoundation/autoware_ai#581](#), such as fIMU & CAN fusion, or adaptive estimation described above). So I implement it separately.

In amathutils_lib package, I added kalman filter libraries as discussed in [#2131](#).

how to run test

You can test with rosbag and gazebo simulator.

gazebo test

With gazebo, please see this [video](#). Note: To use gazebo simulator, you have to setup [this](#).

rosbag test

1. Download rosbag file from [this](#) link. This rosbag includes
 - `/points_raw` (just for visualization)
 - `/ndt_pose` (input for `/ekf_localizer`)
 - `/vehicle_status` (input for `/twist_generator`).
2. Run autoware.

```
$ cd ~/Autoware/ros
$ source ./install/setup/bash
```

```
$ ./run
```

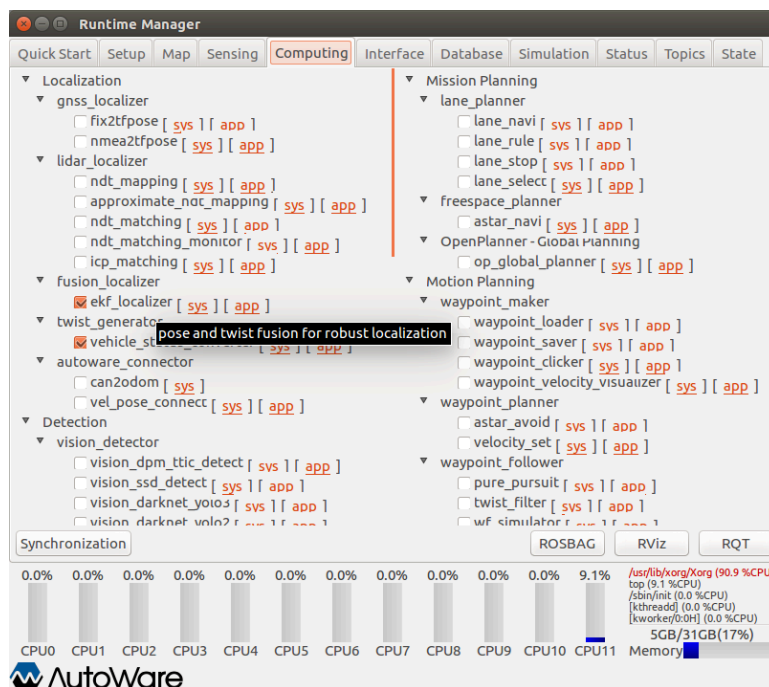

3. Play rosbag: go to the runtime_manager simulation tab, play rosbag.
4. Launch `ekf_localizer` and `twist_generator` : go to the runtime_manager computing tab, check following 2 files as following picture.

- Localization/fusion_localizer/ekf_localizer
- Localization/twist_generator/vehicle_status_converter

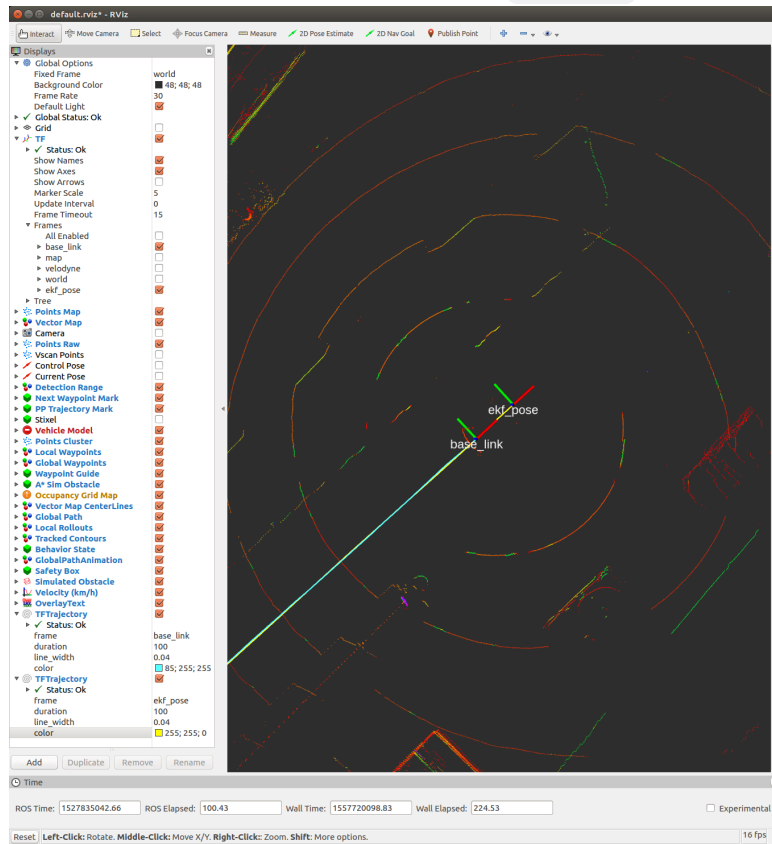

Also you can launch above with this command.

```
$ roslaunch ekf_localizer ekf_localizer.launch  
run ekf_localizer  
$ roslaunch twist_generator  
vehicle_status_converter.launch # run  
twist_converter
```

5. Open Rviz, display TF `ekf_pose` and `base_link` (see picture below for Rviz setup). Note, the `ekf_pose` is placed ahead of the `base_link`, which is the effect of time delay compensation.

This picture includes TF and TFTrajectory. You can also check geometry_msgs::PoseStamped `ekf_pose` in Rviz.

The result pose trajectory with default value is as below.

Only for pose measurement, EKF can compensate for low frequency for pose measurement.

For with twist measurement, EKF can generate smooth pose trajectory.

Please add the DCO sign-off to your commits.

This PR includes many unrelated commits. Please clean up your branch.

They are solved. (This was because this feature branch was created from develop. I recreated from master, cherry-pick, and push -f to solve this.)

Can [#2131](#) be closed?

Yes, I closed.

-  ekf_localizer: remove ndt name, change to pose ... Verified 3de85d1

Using a rosbag covers the node-level test. If you have good tests that can be run on the individual classes, and can implement them, then please do so. We don't necessarily need unit tests for every function. However if the rosbag-based test sufficiently covers the functionality of the node then we can accept that this time. Just remember that the next release cycle is going to get stricter.

However if the rosbag-based test sufficiently covers the functionality of the node then we can accept that this time. Just remember that the next release cycle is going to get stricter.

Ok, I'll write test code where [@amc-nu](#) suggested.

[@amc-nu](#) I confirmed the test process written in PR works after master merge. Should I stop committing? I'm writting some test code for ekf_localizer (if it is not needed, I'll remove this.).

I added test code for ekf_localizer where [@amc-nu](#) mentioned. Also adjust some default parameters. The rosbag test written in PR and it's performance is checked after there commits.

[@TakaHoribe](#) Hello, I need your permission to download your rosbag, it is convenient to send me a copy? hunkyu163@gmail.com

[@hunkyu](#) I changed the permission level so that everyone can download. please check it.

hunkyu commented on Jun 13, 2019

@TakaHoribe Well, you can download it and haven't tested this data set yet. I now use sample_moriyama_150324.bag to evaluate the ekf_localizer module and found that the ekf_pose jitter is quite powerful. Can you trouble me to see what is the reason?

Please ask your question at ROS Answers.

@[hunkyu](#) This discussion should be done in ROS Answers. Would you post the same question there?

<http://answers.ros.org/questions/scope:all/sort:activity-desc/tags:autoware/page:1/query:autoware/>

(For your question, please confirm the `/vehicle_status` is recorded in the rosbag at first, and your setup `/steering_gear_ratio = 1` is reasonable.)
